An internal combustion engine is defined as an engine in which the chemical energy of the fuel is released inside the engine and used directly for mechanical work, as opposed to an external combustion engine in which a separate combustor is used to

Design a four-cylinder Internal Combustion Engine

Define rigid bodies and assemble them to model a piston. Reuse piston components to model a four-cylinder engine.

At any throttle setting, and as torque is increased, the speed of a diesel engine will decrease from its value at zero torque. The difference between the speed at zero torque and the current speed is the engine speed depression, which increases until the fuel pump is at full stroke and delivering –full fuel–.
